Applied Data Scientist | Causal Inference & Marketing Analytics (2+ Years @ Google)

ln3141592653@gmail.com | 631-456-1964 | LinkedIn | GitHub | New York City, NY (open to Hybrid/Remote)

SUMMARY

Analytical data scientist with 2+ years at Google developing experimentation frameworks, causal inference pipelines, and Bayesian models to optimize ad delivery and user experience. Combines deep statistical reasoning with production-grade engineering (Python, SQL, Spark) to translate ambiguous business problems into measurable, data-driven solutions.

EXPERIENCE

Google, Los Angeles, CA **Aug 2022 – Mar 2025**

Software Engineer (Data Science / ML Focus), Fulltime (L3) – Knowledge & Information

Team Meridian - Brand Measurement (AIM)

- Built and deployed **global-scale ad response models** (Hill Saturation, Adstock Decay) using **Python & TensorFlow**, estimating ROI saturation curves and revenue headroom across 100+ brands, informing multimillion-dollar marketing optimizations.
- Integrated **Analyzer, Visualizer, and Optimizer** modules across engineering and data science pipelines, automating insight delivery and increasing analytics adoption by 40% organization-wide.

Ad Load, Placement & Sentiment Team

- Designed and analyzed **50+ controlled experiments** using **Python, SQL, AQLogs**, and **Mendel** to optimize ad load and UI placement; applied Bayesian modeling and counterfactual analysis to determine revenue-neutral thresholds.
- Conducted **Ad-Aware Glue Coverage** analysis to evaluate ad load, query commerciality, and head/tail performance across billions of queries, uncovering long-tail revenue opportunities worth $30M+.

Capital One, Plano, TX (remote) **Jun 2021 – Aug 2021**

Data Engineer Intern

- Developed Snowflake SQL dashboards to monitor engagement and pipeline health, reducing detection time of anomalies by 15%.
- Implemented **MLaaS changepoint detection** to flag data anomalies automatically, reducing manual triage effort by 20%.

NASA Goddard Space Flight Center, Greenbelt, MD **(**remote) **Jan 2021 – May 2021**

Software Engineering Intern

- Engineered a **BERT-based NLP pipeline** for real-time precipitation keyword classification, improving F1 accuracy by 27% and strengthening validation of NASA's Global Precipitation Measurement datasets.

National Science Foundation, Worcester, MA **May 2019 – Aug 2019**

Machine Learning Researcher

- Designed an LSTM-based multi-label classification model on 6K+ patient EHR time series (PyTorch, Scikit-learn), achieving 86% accuracy (+12% over baseline) and informing early-detection research.

EDUCATION

Stony Brook University Honors College **2018-2022**

B.S. Double Major in Computer Science, Applied Mathematics & Statistics; Minor in Music. **GPA: 3.79/4.0**

Relevant coursework: Machine Learning, Probability Theory, Analysis of Algorithms

PROJECTS

Music Industry RAG Intelligence Engine

- Built a production-grade RAG system over music contracts, royalty agreements, and copyright law documents.
- Indexed **hundreds of legal and industry PDFs** using semantic chunking and FAISS vector search.
- Improved top-K retrieval relevance via **neural reranking**, demonstrated with before/after retrieval comparisons.

Generative Summarization & Analytics

- Created LLM-based summarizer for 100-page financial reports; reduced token usage 23% and summary generation cost by 30%.

TECHNICAL SKILLS

Modeling & Statistics: Causal Inference, Bayesian Modeling, A/B Testing, Regression, Time-Series, Experimental Design

Data Engineering & Analysis: AQLogs, Mendel, SQL, Spark, Redshift, Pandas, Data Visualization

Tools & Frameworks: Python, TensorFlow, PyTorch, Scikit-learn, Hugging Face, AWS SageMaker, Git
